When it comes to enterprise security, too often privacy is an afterthought, and sometimes not even considered at all.

Enterprise security systems collect more data than they need to – creating unnecessary employee privacy issues, as well as significant costs associated with excess data storage and processing.

DTEX Systems significantly reduces the amount of data that an organisation needs to collect, eliminating the collection of intrusive data sources which are unnecessary for improving security. This enables the DTEX platform to target high risk events without infringing the privacy of individuals.

DTEX Systems is specifically designed to collect the minimum amount of data needed to build a forensic audit-trail in a privacy compliant manner.

Unlike intrusive employee monitoring solutions, DTEX Systems collects application metadata only.

- **No file scanning**
- **No email content captured**
- **No website content captured**
- **No conversations captured**
- **No screen recording**
- **No keystroke logging**

With DTEX Systems, employees are a source of intelligence rather than the subject of personally invasive surveillance.  For this reason and the others stated above, DTEX Systems is the only solution chosen by many of Europe's GDPR/Privacy experts including 'Magic Circle' law firm, Freshfields Bruckhaus Deringer.
